Keywords:

Strong nuclear gravity, Nuclear elementary charge, Strong coupling constant, Nuclear stability range, Binding energy of isotopes, Magic proton numbers

DOI: 10.15415/jnp.2019.62024

1. Introduction

With reference to 'Stropto (nuclear) gravity' [1,20], if $G_f \approx 10^{38} G_N$ and with reference to the recent symposium proceedings and journal publications [1,1,37], we try to refine our properties concretes with the following three assumptions for an effect of isotope and magic proton number and possible reference of the statement of the sta

$$G_f = \sum_{e=m_p}^{4} \sum_{e=0}^{e_0} h^2 c^2 m_e \simeq 3.329561 \times 10^{28} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2}.$$

2. Assumptions

1) Nuclear charge radius can be expressed as,

 $R_0 \cong \frac{2G_s m_p}{c^2} \cong 1.23929083 \text{ fm}$

2) Strong coupling constant can be expressed as,

ABSTRACT

an in-denth

scussion.

With reference to our earlier published view large nuclear al constant G_{s} , nuclear \cong $(e/e_s)^{ imes}$, \mathbb{R} Istan as paper, we present simple elementary charge e_s and strong coupling relations for nuclear stability range, binding energy sotopes and magic proton numbers. Even though 'speculative' in nature, prov concepts are sin to understand, easy to implement, result oriented, effective and unified. proposed model seems it an across the Planck scale and nuclear scale and can be called as SPA nodel (STRANGE* physics of atomic nucleus). able mass number can be estimated with $A \cong \left| Z + \sqrt{\left(\frac{1}{\alpha} \right) \pm 1} \right|^2$ Summary: Probable range of where $x \cong 1.2$ for $Z \approx (3 \text{ to } 1)$ and $x \cong 1.1$ for $Z \ge 100$. A_s can also be expressed as, re $k \cong 4\pi$ $e^2 G_m^3 \cong 0.006333$. Energy coefficient being $A \cong 2Z + kZ^2$ $\left[e^{2}/8\pi\varepsilon\right]$ (G m MeV, for $Z \approx (5 \text{ to } 118)$, nuclear binding energy can be `)[≈ understood/fitted w $B_{A} \cong \{A_{s} - [(kA_{s}Z/2.531) + 3.531]\} \times 10.06 \text{ MeV} \text{ where}$ rms $(m_s) \cong 2.531$. By considering a third term of the form $\left| \left(A_s - A \right)^2 / A_s \right|$, $(m_{n} - n)$ of Z can be fitted approximately. It needs further investigation. See inding en gy of isoto

$$\alpha_s \cong \left(\frac{\hbar c}{G_s m_p^2}\right)^2 \cong 0.1151937353$$

3) There exists a nuclear elementary charge,

$$e_s \cong \frac{e}{\sqrt{\alpha_s}} \cong \left(\frac{G_s m_p^2}{\hbar c}\right) e \cong 4.720586027 \times 10^{-19} \text{ C}$$

3. Semi Empirical Relations and Applications

1) Proton magnetic moment can be expressed as

$$\mu_p \cong \frac{e_s \hbar}{2m_p} \cong \frac{eG_s m_p}{2c} \cong 1.488142 \times 10^{-26} \text{ J.T}^{-1}$$

2) Ignoring the negative sign, neutron magnetic moment can be expressed as

$$\mu_n \simeq \frac{(e_s - e)\hbar}{2m_n} \simeq 9.817102 \times 10^{-27} \, \mathrm{J.T^{-1}}.$$

3) Nuclear unit radius can be expressed as,

$$R_0 \cong \frac{2G_s m_p}{c^2} \cong \left(\frac{e_s}{e}\right) \left\{ \frac{\hbar}{m_p c} + \frac{\hbar}{m_n c} \right\}$$

4) Root mean square nuclear charge radii can be expressed as,

$$R_{(Z,A)} \cong \left\{ Z^{1/3} + \left(\sqrt{Z(A-Z)} \right)^{1/3} \right\} \left(\frac{G_s m_p}{c^2} \right)$$

5) Nuclear potential energy can be understood with,

$$\cong \frac{e_s^2}{4\pi\varepsilon_0 \left(G_s m_p / c^2\right)} \cong 20.1734 \text{ MeV}$$

6) Nuclear binding energy can be understood with,

$$\frac{e^2 G_s m_p^3}{8\pi\varepsilon_0 \hbar^2} \cong \frac{e_s e}{8\pi\varepsilon_0 \left(\hbar/m_p c\right)} \cong \frac{e_s^2}{8\pi\varepsilon_0 \left(G_s m_p / c^2\right)}$$

7) With reference to $(\hbar/2)$, a useful quantum energy constant can be expressed as,

$$E_{(\hbar/2)} \cong \left(\frac{e^2 G_s m_p^3}{4\pi\varepsilon_0 \left(\hbar/2\right)^2}\right) \cong 80.6934 \text{ MeV}$$

- 8) Close to magic and semi magic proton numbers, nuclear binding energy seems to approach $\left[2.531\left(n+\frac{1}{2}\right)\right]^2 10.0 \text{ MeV}$ where n = 0,1,2,3,... and $\left(m_n m_p/m_e\right) = 2.531.$
- 9) Characteristic melting temperature associated with proton can be expressed as,

$$T_{proton} \cong \frac{\hbar c^3}{8\pi k_B G_s m_p} \cong 0.15$$

10) Characteristic nuclear neuro mass units [3] can be expressed as, $\sqrt{\frac{\hbar c}{G_s}} \simeq 10.62$, LeV/c^2 . It can loo be considered as a characteristic dark patter constituent

Κ

[13]. See relative (26) and Table 8 of section-12 for the estimated by a baryon mass spectrum.

4. Neut proton lass l'aference

Nev on-proto mass difference can be understood with:

$$\frac{1}{n} \frac{2}{2} \frac{m_p c}{2} \cong \ln \sqrt{\frac{E_{(\hbar/2)}}{m_e c^2}} \cong \ln \sqrt{\frac{4e^2 G_s m_p^3}{4\pi \varepsilon_0 \hbar^2 m_e c^2}} \quad (4)$$

5. Neutron Life Time

Neutron life time t_n can be understood with the following relation:

$$t_n \cong \exp\left(\frac{E_{(\hbar/2)}}{\left(m_n - m_p\right)c^2}\right) \times \left(\frac{\hbar}{m_n c^2}\right) \cong 877.3 \text{ sec}$$
(5)

This value can be compared with recommended value of $(878.5\pm0.8)\,\text{sec.}$

6. Understanding Proton-neutron Stability

Let,
$$\left(\frac{m_e c^2}{E_{(\hbar/2)}}\right) \cong \left(\frac{4\pi\varepsilon_0 \hbar^2 m_e c^2}{4e^2 G_s m_p^3}\right) \cong k \cong 0.0063326$$
 (6)
Quantitatively, we noticed that,
$$\frac{e_s^2}{4\pi\varepsilon_0 G_s m_p m_e} \cong 4\pi \times \frac{1}{4k}$$
(7)

The new factor cheeds as ear interpretation and we are working on the for its scope and chaticability. It can be considered as a result oriented number connected with nuclear stability and pinding energy.

Laste mass nume A_s of Z can be estimated with the owing simple relations [38],

$$\cong (N_s + Z) \cong 2Z + kZ^2 \cong 2Z + 0.0063326 (Z)^2 \quad (8)$$

$$= \left[Z + \sqrt{(1/\alpha_s)}\right]^{1.2} \cong \left[Z + 2.9463\right]^{1.2}$$
(9)

where $(e/e_s)(1/k)^{1/4} \cong (\alpha_s)^{1/2} (1/k)^{1/4} \cong 1.2$. It can be called as 'power factor of stability'.

Proton number Z associated with stable A_s can be estimated with the following simple relations,

$$Z \cong \frac{\sqrt{1 + kA_s} - 1}{k} \quad \text{Or} \quad Z \cong \frac{A_s}{1 + \sqrt{1 + kA_s}} \qquad (10)$$

7. Understanding Proton-neutron Stability Range

Considering relation (8), it seems possible to find the best possible range of A_{c} . We noticed that,

Lower stable A_s can be estimated with,

$$(A_s)_{low} \cong \left[Z + \left(\sqrt{(1/\alpha_s)} - 1\right)\right]^{1.2} \cong \left[Z + 1.9463\right]^{1.2}$$
 (12)

Upper stable A_s can be estimated with,

$$A_s \Big|_{up} \cong \Big[Z + \Big(\sqrt{(1/\alpha_s)} + 1 \Big) \Big]^{1.2} \cong \big[Z + 3.9463 \big]^{1.2}$$

Considering a factor of 1.19 in place of 1.2, stable mass numbers of super heavy elements can be fitted. For Z=116, estimated stable mass number range seems to be 292 to 298 and its experimental mass range is 291 to 294 [39]. See Table 2 for a comparison.

8. Notelear handing Exargy Close to Stable Mass Number

Based on the new integrated model proposed by N. Ghahramany of [40,41],

$$B(Z,N) = \left\{ A - \left(\frac{\left(N^2 - Z^2\right) + \delta(N - Z)}{3Z} + 3 \right) \right\} \frac{m_n c^2}{\gamma}$$
(14)

where, $\gamma = \text{Adjusting coefficient} \approx (90 \text{ to } 100).$ if $N \neq Z$, $\delta(N-Z) = 0$ and if N = Z, $\delta(N-Z) = 1$. Readers are encouraged to see references there in [40,41] for derivation part. Point to be noted is that, close to the beta stability line, $\left[\frac{N^2 - Z^2}{3Z}\right]$ takes care of the combined effects of coulombic and asymmetric effects. In this context

effects of coulombic and asymmetric effects. In this context, we propose that,

$$\frac{m_n c^2}{\gamma} \cong \frac{m_n c^2}{(90 \text{ to } 100)} \cong \text{Constant}$$

$$\cong \frac{e_s^2}{8\pi\varepsilon_0 \left(G_s m_p / c^2\right)} \cong 0.09 \text{MeV}$$
(15)

Proceeding further, with the reference to relation (7) it is also possible to show that, $Z \cong (1 \text{ to } 83)$, can be to the beta stability line,

$$\left[\frac{N_s^2 - Z}{Z}\right] = \frac{V_s Z}{16}$$

$$\frac{Z^2}{3Z} \cong \frac{kA_sZ}{3} \tag{17}$$

haved on the above relations and close to the stable mass numbers of $(2 \approx 5 \text{ to } 118)$, with a common energy coefficiency 10.06 MeV, we propose two terms for fitting hunderstanding nuclear binding energy.

N

and be considered as,

$$Term_1 = A_s \times 10.06 \text{ MeV}$$
(18)

Second term helps in **decreasing** the binding energy and can be considered as,

Term_2 =
$$\left(\frac{kA_sZ}{2.531} + 3.531\right) \times 10.06 \text{ MeV}$$
 (19)

where
$$\begin{cases} \left(\frac{\left(m_{n}-m_{p}\right)c^{2}}{m_{e}c^{2}}\right) \cong \ln\left(\frac{1}{\sqrt{k}}\right) \cong 2.531\\ 3.531 \cong 1+2.531 \cong 1+\ln\left(\frac{1}{\sqrt{k}}\right) \end{cases}$$

Thus, binding energy can be fitted with,

$$B_{A_{s}} \cong \left\{ A_{s} - \left(\frac{kA_{s}Z}{2.531} + 3.531 \right) \right\} \times 10.06 \text{ MeV}$$
 (20)

See the following Figure 1. Dotted red curve plotted with relations (7) and (20) can be compared with the green curve plotted with the standard semi empirical mass formula (SEMF) [38,42].

10. Understanding the Sinding mergy of Light Atom Nuclides

It is well callished pat, in light atomic nuclides, coulombic interview seems to path a key role in reducing the binding energy. Based on this context, starting from Z=2 to Z=30, use to stable mass numbers, binding energy can be pressed by the following relations.

$$\cong \left[A_{s} - A_{s}^{\frac{1}{3}} \right] (10.06 - 0.71) \text{ MeV}$$

$$\cong \left[A_{s} - A_{s}^{\frac{1}{3}} \right] 9.35 \text{ MeV}$$
(22)

See the following Table 6.

Table 6: Binding energy of Z = 2 to 30 based on coulombic correction

11. Understanding Magic Proton Numbers

It may be noted that, the nuclear magic numbers, as we know in stable and naturally occurring nuclei, consist of two different series of numbers. The first series -2, 8, 20 is attributed to the harmonic-oscillator (HO) potential, while the second one -28, 50, 82 and 126 is due to the spin–orbit (SO) coupling force [43-46]. In this context, our bold idea is that, atoms are exceptionally stable when their nuclear binding energy approaches,

$$B_{A_s} \simeq \left[2.531 \left(n + \frac{1}{2} \right) \right]^2 10.06 \text{ MeV}$$

Based on point 5 of section-3, close to stable mass number of $Z \approx (2 \text{ to } 100)$, magnitude of nuclear bit for energy can be expressed by a relation of following orm.

$$B_{A_s} \approx \left\{ \left(Z - \sqrt{\ln(Z)} \right) \frac{e_s^2}{4\pi\varepsilon_0 \left(z - n_p/z^2 \right)} \right\} = 1006 \text{ MeV}$$
$$\approx \left[\left(Z - \sqrt{\ln(Z)} \right) * 2..12 \text{ MeV} \right] \pm 10.06 \text{ MeV}$$

where $A_s \approx Z + 0.0063326(Z)$

(24) See the following Figure 11 for the plotted (dotted) black curve company with SE. Signed curve.

Let M_n be a possible magic proton number. Considering relations (23) and (24), it is possible to develop a relation of the following form having a factor (1/2).

erstand the magic proton numbers

Proton number

12. Discussion

11) With reference to the proposed characteristic mass unit of $\sqrt{\hbar c/G_s} \cong 546.62 \text{ MeV}/c^2$, basic baryonic mass spectrum can be fitted with the following relation,

$$m_{Bar}c^2 \cong \left(\frac{n}{\alpha_s}\right)^{\frac{1}{4}} \sqrt{\frac{\hbar c^5}{G_s}} \cong \left(\frac{n}{\alpha_s}\right)^{\frac{1}{4}} 546.6 \,\mathrm{MeV}$$
 (26)

where n = 1, 2, 3, ...

See Table 8. For further details, readers are encouraged to see our published paper [33].

Table 8: Estimated basic baryons rest energy

n	Baryon rest energy (MeV)	n	Baryon rest energy (MeV)

10	1668.5	20	1984.2

- So far no model could succeed in understanting nuclear binding energy with gravity [19]. It is not be confirmed from main stream literature [1-20].
- 3) So far no model could corress a specere implementing strong coupling constant a fow energy nuclear physics.
- So far no model could attempted understand nuclear stability and binding energy with a combined effects of strong nuclear gravity and strong hallear charge.
- 5) Understand nuclear binding energy with a single energy coefficient of magnitud $\frac{e^2}{8 M_0 (G_{s^*} / c^2)} = 0.09 \text{ MeV} \text{ is a challenging task}$
 - Id so far except Ghanramany et al, no one could an approximate of the second se
- 6) Estimation of nucleon stability range is simple in our model compared to SEMF and Ghahramany's model. Interesting point to be noted is that, in our model, nucleon stability range or stable mass numbers can be estimated without considering the binding energy

formula. We have provided different relations for understanding nucleon stability.

- 7) Proposed new and result oriented number $k \cong \left(\frac{4\pi\varepsilon_0 \hbar^2 m_e c^2}{4e^2 G_s m_p^3}\right) \cong 0.0063326$ seems to play a key role in understanding nuclear stability and binding energy vide relations (6), (7), (8), (9), (10), (16) and (20).
- 8) Proposed first tem is not new a prope second term $[(kA_sZ/2.531) + 3.531]$ 10.06 MeV ms to play an excellent role in fitting d understand ng the binding energy of med in and h v stable clides. It can be evidenced im Table 3. Co ctic seems to be required for kinet atomic nuclides. In ceeds further study.
- 9) Proposed userd term $\left[\left(A_s A\right)^2 A_s\right] \times 10.06 \text{ MeV}$ seems to comproximate to first g and understanding the bading energy of isotopes. We are working on it for its validation better alternative with respect correct stable mass number of Z. For example, see the following Table 9.

ple 9: Binding error by of isotopes of Z = 8, 10 and 20

- 10) In deuteron, binding energy seems to be proportional to e^2 and in other atomic nuclides, binding energy seems to be proportional to e_s^2 .
- 11) Considering the average of (e^2, e_s^2) and without considering 0.71 MeV (as there exists only one proton), based on relation (22), binding energies of ${}_{1}^{2}H$ and ${}_{1}^{3}H$ nuclides can be estimated as, $\left[2-2^{\frac{1}{3}}\right]5.6 \cong 4.15$ MeV and $\left[3-3^{\frac{1}{3}}\right]5.6 \cong 8.72$ MeV respectively.
- 12) Considering the average of (e^2, e_s^2) and considering 0.71 MeV (since there exists two protons), based on relation (22), binding energy of ${}_2^3He$ can be estimated

as,
$$\left| 3 - 3^{\overline{3}} \right| 4.9 \cong 7.63$$
 MeV.

13) Coulombic energy coefficient being 0.7 MeV, reference to $\ln \left(\frac{e^2}{4\pi\varepsilon_0 G_s m_p m_e} \right) \cong 1.515$,

volume or surface energy coefficient can be a pressed as 1.515*10.09 = 15.3 MeV and a symmetric energy coefficient can be expressed $(> 1.5)*15^{\circ}$ MeV. Thus, 10.09 MeV, 10.5 MeV and 23.0 MeV seem to follow a geometric codes with a geometric ratio of 1.515. For ($Z \ge 10^{\circ}$, bind us energy can also be estimated with,

$$B_{A} \cong \left(A \times 4^{-3} - 1\right) \oplus 5.3 \text{MeV} - \frac{Z^{2}}{-2} * 0.71 \times V - \frac{\left(A - 2Z\right)^{2}}{-2} * 23.0 \text{MeV}$$
(27)

- 14) with advanced research in high energy nuclear physics, has onice a maintenance of the understood and bare quantities of the made identifiable.
- 15) With hoher research in nuclear astrophysics, it is certainly possible to understand the combined effects of Newtonian gravitational constant and proposed nuclear gravitational constant. Considering the ratio of nuclear gravitational constant and Newtonian gravitational constant, estimated masses of white dwarfs, neutron stars and black holes [48,49], can be fitted approximately. For example,

$$M_{X} \approx \left(\frac{G_{s}}{G_{N}}\right) \sqrt{\frac{e^{2}}{4\pi\varepsilon_{0}G_{N}}} \approx 0.473M_{\odot}$$

$$M_{X} \approx \left(\frac{G_{s}}{G_{N}}\right) \sqrt{\frac{e_{s}^{2}}{4\pi\varepsilon_{0}G_{N}}} \approx 1.373M_{\odot}$$

$$M_{X} \approx \left(\frac{G_{s}}{G}\right) \sqrt{\frac{\hbar c}{G}} \approx 5.456M_{\odot}$$

$$(28)$$

$$M_{X} \approx \sqrt{\frac{G_{s}}{G_{N}}} \frac{e^{2}}{4\pi\varepsilon_{0}G_{*}m_{p}} = 0.023M_{\odot}$$

$$M_{X} \approx \sqrt{\frac{G_{s}}{G_{N}}} \frac{e^{2}}{4\pi\varepsilon_{0}G_{*}m_{p}} \approx 0.2M_{\odot}$$

$$M_{X} \approx \sqrt{\frac{G_{s}}{G_{N}}} \frac{e^{2}_{s}}{4\pi\varepsilon_{0}G_{*}m_{p}} \approx 0.2M_{\odot}$$

$$M_{X} \approx \sqrt{\frac{G_{s}}{G_{N}}} \left(\frac{1}{G_{N}m_{p}}\right) \approx 3.14M_{\odot}$$
(29)

16) At the moment of a neutron star's birth, the nucleons the compose is now a temperature of around 10^{11} to 10^{12} K [50]. Equation black hole's mass-energy density and thermal energy density [51,52,53], it is possible to show that,

$$\int \simeq 0.4615 \frac{\hbar c^3}{k_B G_N \sqrt{M_B M_{pl}}}.$$
 (30)

$$M_{pl} \cong \sqrt{\frac{\hbar c}{G_N}} \cong 2.176 \times 10^{-8} \mathrm{kg}$$

 $M_{_B} \cong$ Mass of blackhole

and $T_{\scriptscriptstyle R} \cong$ Temprature of blackhole

This just resembles famous Hawking's Black hole temperature formula [54] with a change in its effective mass $\sqrt{M_B M_{pl}}$. With reference to relation (29), considering M_X as a critical mass for neutron stars and black holes, corresponding critical temperature can be fitted with,

$$T_{\chi} \approx \frac{\hbar c^3}{8\pi k_B G_N \sqrt{M_B M_{pl}}}$$
(31)

Quantitatively, Fermi's weak coupling constant [55] and electron rest mass can be fitted with the following relations.

$$G_F \cong \left(\frac{m_e}{m_p}\right)^2 \hbar c R_0^2 \cong \frac{4G_s^2 m_e^2 \hbar}{c^3}$$
(32)

$$m_e \simeq \sqrt{\frac{G_F c^3}{4G_s^2 \hbar}}$$
 and $\frac{2G_s m_e}{c^2} \simeq \sqrt{\frac{G_F}{\hbar c}}$ (33)

18) In a theoretical and verifiable approach, magnitude of the Newtonian gravitational constant can be estimated with nuclear elementary physical constants [56, 57]. For example, with reference to Planck scale, we noticed that,

$$\frac{\pi R_0^2}{\pi R_{pl}^2} \cong \frac{G_s^2 m_p^2}{G_N \hbar c} \cong \left(\frac{m_p}{m_e}\right)^{12}$$
(34)

where, $R_0 \cong \frac{2G_s m_p}{c^2}$, $R_{pl} \cong \frac{2G_N M_{pl}}{c^2} \cong 2\sqrt{\frac{G_N \hbar}{c^3}}$

$$\left(\frac{m_p}{m_e}\right) \cong \left(\frac{G_s m_p^2}{\hbar c} \times \frac{G_s}{G_N}\right)^{\frac{1}{12}} \cong \left(\frac{e_s G_s}{e G_N}\right)^{\frac{1}{12}}$$
(35)

$$G_{N} \cong \left(\frac{m_{e}}{m_{p}}\right)^{10} \left(\frac{G_{F}c^{2}}{4\hbar^{2}}\right) \cong \left(\frac{m_{e}}{m_{p}}\right)^{12} \left(\frac{G_{s}m_{p}^{2}}{\hbar c}\right) G_{s} \qquad (36)$$

$$G_F \cong \left(\frac{m_p}{m_e}\right)^{10} \frac{4\hbar^2 G_N}{c^2} \tag{37}$$

$$\left(\frac{m_p}{m_e}\right) \cong \left(\frac{G_F c^2}{4\hbar^2 G_N}\right)^{\frac{1}{10}}$$
(38)

19) Another very interesting relation is,

$$\left(\frac{m_p}{m_e}\right)^{10} \cong \exp\left(\frac{1}{\alpha_s}\right)^2$$

20) If,
$$G_s \cong \frac{4\pi\varepsilon_0 h^2 c^2 m_e}{e^2 m_p^3} \cong 3.329561 \times 10^{28} \text{ m}^3$$

$$\begin{cases} \alpha_s \cong 0.115194 \\ G_F \cong 1.44021 \times 10^{-62} \text{ .m}^3 \\ G_{-2} \cong 6.679856 \text{ .c} 0 \text{ .m}^3 \text{ kg}^{-1} \text{ sec}^{-2} \end{cases}$$

21) If
$$\alpha_s \simeq \left[\sqrt{\ln \left(\frac{m_s}{2} \frac{m_s}{2} \right)^2} \right]^{-1} \simeq 0.1153515$$

$$\begin{cases} G_s \simeq 3.35 \times 83 \times 10^{28} \text{ sc} \text{ kg}^{-1} \text{sec}^{-2} \\ G_h \simeq 1.4382 \times 10^{-11} \text{ J.m}^3 \\ G_s \simeq 6.670719 \times 10^{-11} \text{ m}^3 \text{ kg}^{-1} \text{sec}^{-2} \end{cases}$$
(41)

22) With the rence to the macroscopic Planck's constant and macrocopic strong coupling constant, average values seem to be:

$$\begin{cases} \alpha_s \cong 0.115273 \\ G_s \cong 3.32842 \times 10^{28} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2} \\ G_F \cong 1.43922 \times 10^{-62} \text{ J.m}^3 \\ G_N \cong 6.675285 \times 10^{-11} \text{ m}^3 \text{kg}^{-1} \text{sec}^{-2} \end{cases}$$
(42)

- 23) Relations (34), (35) and (38) seem to indicate the direct role of G_N in microscopic physics. We are working on understanding their physical significance with respect to proton-electron mass ratio.
- 24) Our proposed assumptions seem to ease the way of understanding and refining the basic concepts of final unification [58, 59, 60].

Conclusion

Liquid drop model, Fermi model. ntum chromodynamics and string heory dels are la ing in implementing the strong pupling const t and Lavity in basic nuclear structure in this context, une tranding and estimating nuclear bind, every gy with 'strong interaction' and 'unification' sincepts on to be gove interesting and needs a serie acconsideration between level. Even though they are so in envirial, section 2, and relations (6), (7), (8), (9), (10), (11), (2), (21), (24), (26), (27), (28), (29), (30, (31), (34), (35), (39) and (42) can be considered ravorable or supporting tools for our proposed model. ne very interesting point to be noted is that, our proposed del seems to AN across the Fermi scale and Planck With fur ter research, mystery of magic numbers cood and a unified model of nuclear binding can by ergy and stability scheme pertaining to high and low ne. Auclear physics can be developed.

Acknowledgements

Authors are very much thankful to Dr. N. Ghahramany and team for their intuitive and heuristic contributions in this most advanced field of nuclear research. Author Seshavatharam is indebted to professors shri M. Nagaphani Sarma, Chairman, shri K.V. Krishna Murthy, founder Chairman, Institute of Scientific Research in Vedas (I-SERVE), Hyderabad, India and Shri K.V.R.S. Murthy, former scientist IICT (CSIR), Govt. of India, Director, Research and Development, I-SERVE, for their valuable guidance and great support in developing this subject. Authors are thankful to the anonymous reviewers for their kind and valuable suggestions in improving the quality of the paper.
